

Model:

使用 Resnet18 作為 pretrain model，會使用 Resnet18 作為 pretrain model 的原因是因為用其他 Model 的運算時間太久，無法快速的微調數值，

Data Loader:

Batch size = 32

Data Augmentation:

因為資料量夠大，所以沒有像第三次作業使用這麼多的圖片變更

```
transforms_train = transforms.Compose([
    transforms.Resize((256, 256)),
    transforms.RandomCrop((224, 224)),
    transforms.ToTensor(),
    transforms.Normalize(mean=[0.485, 0.456, 0.406], std=[0.229, 0.224, 0.225]),
])

#####
#                                     End of your code
#####

# For VAL, TEST
#####
# TODO: use transforms.xxx method to do some data augmentation
# This one is for validate and test,
# NOTICE some operation we usually not use in this part
#####
transforms_test = transforms.Compose([
    transforms.Resize((256, 256)),
    transforms.CenterCrop((224, 224)),
    transforms.ToTensor(),
    transforms.Normalize(mean=[0.485, 0.456, 0.406], std=[0.229, 0.224, 0.225]),
])
```

Define loss and optimizer:

```
# TODO: Define loss and optimizer functions
criterion1, criterion2 = nn.CrossEntropyLoss(), nn.BCEWithLogitsLoss()
optimizer = torch.optim.Adam(model.parameters(), lr=1e-3)
scheduler = optim.lr_scheduler.StepLR(optimizer, step_size=20, gamma=0.1)
```

10epoch:1e-3

10epoch:1e-4

10epoch:1e-5

下面是我的圖:
